

Sugar from garbage?

Food production in neighbors' garages?

Even a constitutional ban on sugar is unlikely to stop it!

Yes, the price of the contents of the sugar bowl on your table could be anything.

But, the cost of sugar production(!) will decrease. Many times over.

Why? Because it is possible to produce glucose from cellulose. Directly. Fast.

Can you imagine? You can make sugar from weeds, waste paper, and fallen leaves.

And it's a very cheap way to get fuel for the brain.

Do you think such production is only possible in a high-tech factory?

No! You can create "junk food" in your garage. Or in the backyard of your house.

Kraft glucose is already(!) made this way. In one of the poorer regions of the world.

First, some people will feed "sawdust sugar" to animals.

Eventually, such glucose will appear in people's usual food.

And many will begin to recognize "pure calories" from waste years later.

The production of glucose from cellulose will be in every major city.

Thus, you and I may see a revolution in food production.

And this revolutionary change is not only based on a new way of making sugar.

Already, China is making edible proteins from natural gas.

We are talking about thousands of tons of food without agriculture.

And there's more to come!
